CCJ Uranium Thesis (Primary)

Independent fundamental investment analyst for Cameco Corporation (CCJ). Evaluates financial performance, cash flow, balance-sheet strength, uranium operations, production, deliveries, realized pricing, Westinghouse, utility contracting, uranium supply and demand, nuclear-energy growth, valuation, catalysts, risks, and fundamental positioning versus NXE, UEG, UUUU, and DNN. Produces evidence-based near-term and long-term outlooks, applies the attached CCJ fundamental-analysis and slide-design skills and Notebook research standards, and identifies contrary evidence and thesis-invalidation conditions. Produces the primary report in a two-sided blind adversarial protocol, paired with an independent opposition agent and locked before comparison. Does not rely on RSI, MACD, chart patterns, momentum, support and resistance, or other technical indicators when forming fundamental conclusions.

Instructions

Suggest improvements

ROLE You are the CCJ Fundamental & Uranium Thesis Analyst, an independent fundamental investment analyst covering Cameco Corporation (CCJ), uranium markets, nuclear fuel cycles, utility contracting, uranium producers and developers, and nuclear supply chains. You produce the PRIMARY report in a two-sided blind adversarial protocol. A separate Opposition Analyst answers the same question blind to your work, and you are blind to theirs. INFORMATION FIREWALL Do not request, receive, infer from, or use the opposition agent's recommendation, directional label, evidence, reasoning, notes, confidence score, targets, catalysts, invalidation logic, prompt, tool history, or drafts. Lock your initial report before any cross-agent comparisons do not revise it to align with another agent. Issue any response to disclosed disagreement as a separate addendum. Do not base conclusions on RSI, MACD, chart patterns, momentum, or other technical indicators; evaluate whether fundamentals support or contradict the thesis. Follow Notebook-level instructions on evidence, sourcing, confidence, valuation, transparency, and communication. Apply the attached skills for full detail: 4-site source cap, external-source tiering, confidence-scoring rubric, deck, script, and visual-format specification. PRIMARY OBJECTIVE Produce the highest-quality

BLIND ADVERSARIAL AGENT PROTOCOL

BLIND PROTOCOL AGENT CHAT PROTOCOL

- ✓ Chats held outside of the M365 Notebook
- ✓ Completely independent chat threads
- ✓ No information leakage
- ✓ Results evaluated from each chat output with 3rd chat thread

PRIMARY ANALYST AGENT MANDATE

- ✓ Conducts neutral, evidence-led fundamental analysis
- ✓ Evaluates core operating thesis & commercial drivers
- ✓ Assesses multi-year growth & valuation mechanics
- ✓ Must support claims with audited primary sources
- ✓ Locks work independently before seeing Opposition

OPPOSITION ANALYST AGENT MANDATE

- ✗ Constructs strongest legitimate skeptical stress-test
- ✗ Identifies where execution & valuation may fail to convert
- ✗ Not bearish at all costs — must present mitigating facts
- ✗ Cannot manufacture fake disagreement or invent claims
- ✗ Challenges prevailing thesis to produce true committee test

view

Agent Results Scoreboard:

Primary Agent

**Moderately
Bearish
near-term**

**Moderately
Bullish
long-term**

Confidence: **80 / 100**

- Real quality:
 - Contracted deliveries
 - Reserves,
 - Westinghouse
- Safety margin is thin
- Near-term cash conversion lags

Opposition Agent

**Moderately
Bearish
near-term**

**Neutral
long-term**

Confidence: **80 / 100**

- Not a demand-collapse thesis
- Expectations & cash-conversion gap
- Valuation in years of flawless execution

Both agents independently reached the same near-term call from opposite starting mandates; they diverge only on the multi-year read.

Agentic Common Ground:

Uranium market is genuinely tight

- Long-term price indicator **US\$96.50/lb** August 2026
- Up from US\$81.00 YOY
- World mine supply covered only **~90%** of 2024 demand.

The contract book is real

- Cameco has finalized deliveries
 - Averaging **~28M lb/year, 2026–2030**
- Against U.S. utility unfilled requirements
 - **186.3M lb through 2035.**

Westinghouse pays cash, unevenly

- US\$49M + US\$171.5M distributed in 2025
- Another US\$49M in early 2026
- But Q1 2026 attributable IFRS
- Result was a **C\$46M net loss** C\$122M adjusted EBITDA.

Q2 2026 was a soft quarter

- Net earnings fell to **C\$25M vs** much stronger 2025
- Lower planned deliveries
- Attribute this mainly to timing, not demand.

PRIMARY AGENT · FUNDAMENTAL CASE

- ✓ **Quality is real.**
- ✓ **The margin of safety is thin.**
- ✓ **Cameco is the strongest, most diversified franchise in the uranium space**
— **production, contracting, fuel services, and Westinghouse.**
- ✓ **The open question:**
— **Does today's price already assumes years of flawless execution?**

2025 YOY genuine step up — the question is persistence

Source: Cameco 2025 Annual Report; Cameco Annual Highlights, 2025 results

The demand runway is real — but it's back-end loaded

Structural gap:

- **186.3M lb** of U.S. utility requirements Unfilled for 2026–2035
 - Against **174.1M lb** already under contract industry-wide
- Demand accelerates sharply **after 2030**
 - ❖ Contracting urgency
 - Cameco's pricing power
 - builds late in the decade, not this year.

Execution Risk Now, Earnings Leverage Later

Rank	Primary risk	Offsetting catalyst	Timing
HIGH	Production / mine development miss	2026 guidance execution	Near
HIGH	Purchased-uranium margin compression	Post-2028 contract resets	Medium
HIGH	Valuation compression	Westinghouse recurring cash	Medium
MED-HIGH	Inkai timing / geopolitics	Utility replacement demand	Medium
MEDIUM	Global supply response arrives	Reactor completions	Long

Counterintuitive but disclosed by Cameco

- **A US\$5/lb spot increase**
 - Adds C\$14M revenue
 - Subtracts C\$12M of cash flow near-term
 - purchase exposure reprices faster than capped sales.

Bearish / bullish trigger

- **Bearish:**
 - Repeated guidance misses
 - Purchases priced above realized sales
- **Bullish:**
 - Execution
 - Attractive contracts
 - Durable Westinghouse distributions.

Not a demand story. A price story

The strongest skeptical case never argues uranium demand is collapsing.

Argument:

- Market has already paid for future years of
 - Flawless execution across:
 - Contracting, delivery, and Westinghouse
 - before any of it has happened.

The Valuation Gap Using Cameco's filed numbers alone

Opposition Agent deliberately dropped:

- ❑ Yahoo's vendor-calculated P/E and EV/EBITDA figures
- ❑ Recomputed from Cameco's own TSX market capitalization and 2025 results

94×

market cap ÷ 2025 net earnings

C\$55.4B ÷ C\$590M

US\$39.9B ÷ US\$425M

39×

market cap ÷ 2025 operating cash flow

C\$55.4B ÷ C\$1.408B

US\$39.9B ÷ US\$1.014B

The market is pricing several years of earnings growth Cameco hasn't yet delivered.

Adjusted EBITDA Wrong Lens: IFRS Earning Better Fit

Management blames delivery timing and lower planned 2026 sales — not demand.

Opposition Agents's counter:
H1 uranium adjusted EBITDA rose
C\$676M from C\$641M
— the full-year picture is calmer than one quarter.

Source: Cameco Quarterly Reports, Q1 2026 (May 5) and Q2 2026 (July 31)

Skeptic Agent Does Not Argue Over Supply

90%

2024 mine supply covered only
this share of world demand

186.3M lb

U.S. utility requirements
still unfilled through 2035

US\$96.50

August 2026 long-term price,
up from US\$81.00 a year prior

Evidence	Effect on the skeptical case
Mine supply below demand	Contradicts a broad bear case
Unfilled utility requirements	Supports the contracting runway
Rising long-term price	Supports future realized prices

Opposition's own conclusion: **the debate is earnings timing and valuation — not industry direction.** Hence Neutral, not Bearish, long-term.

The real disagreement: has the multi-year case already been paid for?

Primary Agent's Weighting

The contract book, reserves, and reactor pipeline underwrite growth.

Execution risk is real but resolvable — the long-term case earns the benefit of the doubt.

Opposition Agent's Weighting

The same facts are already visible to the market and priced at 94× earnings.

Being right on uranium isn't enough — the stock must also be cheap enough to reward it.

Both agents used identical facts and the same four authorized sources; the divergence is in how each weighs execution certainty against price already paid

What resolves the debate, and when?

Earnings-and-cash-flow

IFRS over the next two/four quarters will settle it.

Synthesized from both agents' conditions and risk/catalyst maps

Company
Source

Gemini acts as the red team - Summary

1. Check the consistency of the data used vs the data source
2. Check the source used is the most updated one

Dashboard Reference	Metric / Section	Audit Verification Check	Auditor Finding & Notes
Uranium Industry Intelligence (image_8cb23f.png)	Spot & Long-Term Pricing	Cross-referenced summary KPI cards (\$65/lb Spot, \$81/lb Long-term) against the end-of-year (December) nodes on the "Uranium price trends" chart.	Internally Consistent. Chart data accurately reflects the summarized headline figures. Data is flagged as illustrative.
Uranium Industry Intelligence (image_8cb23f.png)	Policy & Regulatory Tracker	Reviewed alignment of region flags, topics, and stage statuses (Review, Proposal, Hearing).	Structurally Sound. UI elements and text formatting are correctly aligned, though data is conceptually illustrative.
Cameco Company Monitor (image_8cb23a.png)	Revenue & Operating Cash Flow	Cross-referenced top summary cards (C\$800m Revenue, C\$220m Operating cash flow) against the Q4 data in the "Earnings & cash generation" bar chart.	Internally Consistent. The Q4 chart bars explicitly match the headline financial summary metrics.
Cameco Company Monitor (image_8cb23a.png)	Free Cash Flow (FCF) Calculation	Independently calculated FCF using provided metrics: Operating Cash Flow (C\$220m) minus Capital Expenditure (C\$80m).	Formulaically Accurate. Auditor calculation yields C\$140m, which perfectly matches the stated Free Cash Flow metric on the dashboard.
Both Dashboards	Overall Data Validity	Evaluated data sourcing, footnotes, and header tags across both provided views.	Disclaimer Noted.

Concerns & for further study

1. It's still manual to use another AI to act as the red team; however, a necessary step that can't be skipped
2. The industry source contains forecasts published by Cameco, which may be too optimistic
3. The dashboard can be more interactive & for every data contains a data source for human check

Output 2: Company analysis with infographics

7. Red team for counterargument

NUCLEAR ENERGY

The industry behind Cameco

From uranium in the ground to reliable electricity

CLEAN ENERGY
STRONGER
TOMORROWS

PEOPLE
RESOURCES
BRIGHTER LIVES

HOW IT WORKS

Splitting uranium atoms releases heat. Steam drives a turbine to generate electricity.

Reliable power

Low lifecycle emissions

Fuel must be replenished

THE FUEL JOURNEY

NATURAL RESOURCES
A BRIGHTER TOMORROW

1

Mine & mill

Extract uranium and produce concentrate.

2

Convert

Prepare uranium for the next fuel step.

3

Enrich

Increase U-235 for most reactor types.

4

Fabricate

Make fuel pellets and assemblies.

5

Generate power

Utilities operate reactors and sell electricity.

6

Manage used fuel

Cool, store and manage radioactive materials.

Simplified cycle. CANDU reactors generally use natural uranium without enrichment.

Nuclear energy continued

WHERE CAMECO FITS

SUPPLYING A CLEANER, BRIGHTER FUTURE

URANIUM

Mining and uranium supply

FUEL SERVICES

Refining, conversion and CANDU fuel fabrication

WESTINGHOUSE • 49% OWNED

Reactor technology, fuel and maintenance

Cameco supplies the nuclear industry; utilities sell the electricity.

WHAT SUPPORTS DEMAND

Existing reactors need recurring fuel

Reactor life extensions and new builds

Energy security and rising power demand

WHAT CAN GO WRONG

Mine disruptions and fuel bottlenecks

Construction delays and cost overruns

Policy changes and waste challenges

THE INVESTOR LENS

Spot uranium prices are only part of the story. Long-term contracts, delivery timing and production costs shape supplier earnings.

REAL ASSETS
ESSENTIAL ENERGY
LASTING VALUE

Cameco

Company Intro (Part 1)

A beginner's guide to the nuclear energy supplier

NYSE: CCJ | TSX: CCO | Canada

Fueling
a cleaner,
brighter tomorrow.

URANIUM
FROM THE GROUND

FUEL FOR
TODAY AND TOMORROW

NUCLEAR ENERGY
FOR A CLEANER WORLD

CLEAN ENERGY
STRONGER COMMUNITIES
BRIGHTER POSSIBILITIES

What does it do?

Cameco supplies uranium, fuel services and reactor technology to the nuclear power industry.

Three businesses to understand

01

URANIUM

Mines and sells the raw material used in nuclear fuel.

Key assets: Cigar Lake and McArthur River / Key Lake in Canada; JV Inkai in Kazakhstan.

02

FUEL SERVICES

Refines and converts uranium, and manufactures fuel for CANDU reactors.

03

WESTINGHOUSE

49% ownership

Provides reactor technology, nuclear fuel and services for operating plants and new reactors.

How it makes money

Uranium deliveries + fuel services + its share of Westinghouse earnings

Long-term contracts support visibility. Selling prices adjust over time, so spot uranium prices do not flow immediately into earnings.

Cameco

Company Intro (Part 2)

Scale at a glance | Q2 2026 reporting

C\$3.32–3.57bn

2026 consolidated revenue guidance

Management forecast; excludes Westinghouse revenue, which is equity-accounted.

Over 28m lb / year

Average contracted uranium deliveries over the next five years

Contract commitments, not annual mine production.

What could drive growth?

- More nuclear plants and reactor life extensions
- Utilities signing long-term fuel contracts
- Higher realized uranium prices over time
- Westinghouse services and new-reactor orders

What could go wrong?

- Mine disruptions and higher purchase costs
- Weaker uranium prices or slower contracting
- Reactor delays and geopolitical disruption
- A high share valuation despite business growth

The investment question

Can nuclear demand growth translate into higher cash flow at an attractive share price?

Source: Cameco Q2 2026 MD&A (July 30, 2026) and earnings call (July 31, 2026), supplied documents. Guidance is not a guarantee.

A CLEANER TOMORROW
IS A BRIGHTER TOMORROW.

Cameco

2026 Q2 Financial results summary (Part 1)

 REVENUE C\$814m -7% YoY	 ADJUSTED EBITDA C\$391m -42% YoY	 ADJUSTED NET EARNINGS C\$77m -75% YoY	 OPERATING CASH FLOW C\$131m -72% YoY
---	--	--	--

i Comparison effect: Q2 2025 included US\$170m of Cameco's share of Westinghouse revenue tied to Dukovany.

01 URANIUM: PRICING UP, MARGINS DOWN

ESSENTIAL TODAY.
BRIGHTER TOMORROW.

Realized price:
C\$93.13/lb
(+15%)

Unit cost:
C\$70.81/lb
(+26%)

Gross margin:
24% vs. 31%

Unit cost includes depreciation and amortization.

Contract pricing improved, but higher costs and lower deliveries weighed on Q2.

Owned uranium production:
19.5–21.5m lb
Unchanged

Management guidance • Pricing and FX support the upgrade; cost guidance also rose.

CLEAN ENERGY
STRONGER
COMMUNITIES

2026 Q2 Financial results summary (Part 2)

03 EARNINGS CALL: TWO GROWTH DRIVERS

From today's resources
to tomorrow's possibilities.

Better uranium contracts

Management reports rising floors and ceilings in new contracts.

Existing portfolio commitments average ~28m lb/year for 2026–2030.

Westinghouse expansion

49% owned by Cameco

Up to 91 potential AP1000 reactors

Pipeline is not contracted backlog.

2026 Westinghouse guidance depends on US definitive agreements and progress on at least one project.

04 CASH & EXECUTION CHECK

DISCIPLINE TODAY.
OPPORTUNITIES TOMORROW.

C\$109m

H1 operating cash flow

-81% YoY

C\$1.1bn

cash

~C\$1.0bn

debt

Cameco balances at June 30; investee debt is separate.

Key Lake maintenance and restart

Inkai shipment timing

Q4 Westinghouse delivery and cash recovery

ANALYST TAKEAWAY

Constructive long term; near-term conviction requires reliable production, stronger cash conversion and signed projects.

Adjusted earnings and EBITDA are non-IFRS measures. H1 = first six months. All dollars explicitly labeled.

Sources: Cameco Q2 2026 MD&A and financial statements; Q2 2026 earnings call. Outlook reflects July 2026 disclosures.

Competitor analysis

KAZATOMPROM

SCALE & ISR ECONOMICS

✓ Large Kazakhstan production platform; structural ISR advantages

⚠ Watch: acid supply, rising taxes and jurisdiction risk

NEXGEN ENERGY | NXE

CANADIAN GROWTH

✓ Arrow offers substantial future uranium supply

⚠ Under construction: financing, capex and delivery risk

URANIUM ENERGY CORP | UEC

UNHEDGED PRICE EXPOSURE

✓ US ISR production and a 100% unhedged strategy

⚠ Small production base; ramp-up and cost execution matter

ORANO | UNLISTED

FUEL-CYCLE BREADTH

✓ Established mining, conversion, enrichment and recycling

⚠ Capital intensity and geopolitical exposure

THE INVESTMENT IMPLICATION

- ✓ Cameco: operating quality and diversified nuclear exposure
- ✓ Peers: greater scale, project growth, spot sensitivity or SWU capacity
- ⚠ A strong business still requires a disciplined entry valuation.

Cameco

Cameco price chart

CAMECO | Five-year price history & key events

Cameco

Cameco Catalysts - Summary

01 URANIUM CONTRACTS

Quarterly through 2028

BULL Stronger floors and upside exposure

BASE Gradual contract repricing

BEAR Utilities delay purchases

Watch: realized price versus supply cost

02 MINE EXECUTION

2026 results + 2027–2028 guidance

BULL Reliable output; fewer extra purchases

BASE Production broadly meets guidance

BEAR Outages force costly replacement supply

Watch: McArthur River / Key Lake and Cigar Lake

03 US AP1000 ORDERS

Financing milestones | 2026–2028

BULL Funded projects and component orders

BASE Selected projects advance gradually

BEAR Financing or customer commitments slip

Watch: binding agreements and investment decisions

04 WESTINGHOUSE CASH FLOW

Q4 2026 delivery + 2027–2028 growth

BULL Service growth and stronger distributions

BASE Earnings grow; investment absorbs cash

BEAR Spending rises while projects slip

Watch: cash distributions, not EBITDA alone

05 PORT HOPE RENEWAL

Hearings: Q4 2026 | Licence expiry: Feb 2027

BULL Timely renewal and stronger output

BASE Renewal and stable operations

BEAR Delays, restrictions or interruptions

Watch: licence decision and conversion margins

06 GLOBAL REACTOR PROJECTS

V.C. Summer decision deadline: March 2028*

BULL International pipeline becomes orders

BASE Engineering advances selectively

BEAR Funding and approvals delay projects

Watch: signed work, not announced reactor counts

Catalyst scenarios

Catalyst	Green: stronger evidence	Red: weaker evidence
01 Uranium margin	Updated full-year outlook or full-year actual above C\$91–96/lb, with unit cost inside C\$63–67.50/lb and gross profit up. A quarter is an interim signal, not a beat.	Spot rises but realized price lags (H1 2026: spot +25%, realized +12% in US\$) and gross profit flat or down.
02 Supply execution	Site output tracks 19.5–21.5M lb; purchases stay within ~8M lb committed plus up to 3M lb market.	Disruptions push purchases beyond plan or lift purchased-pound cost and unit cost of sales.
03 Westinghouse cash	Definitive AP1000 agreements signed; Cameco's equity earnings and dividends received then rise.	Projects slip or Cameco's share of capex rises while dividends received stay limited.

Yellow, mixed: a binding event (agreement, licence, financing) is signed but reported margin, equity earnings or dividends have not yet changed; or timing slips a quarter or more.

Next checks, at each results release and relevant project announcement: uranium realized price, unit cost of sales, gross profit, site production, purchases, inventory; Westinghouse signed orders, equity earnings, Cameco's share of capex, dividends received. Judge against the full-year outlook, not one quarter.

Also watch (secondary): Port Hope licence renewal hearing, Nov. 2026 (current licence expires Feb. 28, 2027); routine renewal mainly preserves operations. Possible Westinghouse IPO: confidential draft filing announced July 31, 2026; share count and price range not determined as of Sept. 18, 2026.

Cameco: three main catalysts for the next 24 months

Catalyst	Operating baseline (2026)	Question the results must answer
01 Uranium contracts & delivered margin	Realized price: C\$91–96/lb U ₃ O ₈ Unit cost of sales (incl. D&A): C\$63–67.50/lb	<i>Do reported realized price and uranium gross profit improve together?</i> Next checkpoint: Q3 2026 results (Oct/Nov 2026); full-year actual vs guidance, Feb 2027
02 Mine & supply execution	Production: 19.5–21.5M lb U ₃ O ₈ Deliveries: 29–32M lb; ~8M lb committed + up to 3M lb market purchases, plus inventory, fill the gap	<i>Do mine output, purchased-pound costs and inventory stay consistent with the plan?</i> Next checkpoint: Q3 site production, purchases and inventory; any revision to the 19.5–21.5M lb range
03 Westinghouse orders & cash	Structure (fact, not guidance): 49% interest, equity method 2026 guidance, Cameco share: adj. EBITDA US\$370–430M; capex US\$160–200M	<i>Do definitive orders show up as Cameco's equity earnings and dividends received?</i> Next checkpoint: Any definitive US AP1000 agreement; Q3 equity earnings and dividends received

A favorable headline matters most when it improves reported margin or cash beyond the existing baseline.

Baseline: Cameco 2026 guidance, Q2 2026 MD&A (July 31, 2026); ownership row is a structural fact. Guidance is an operating baseline, not evidence of what the share price assumes. Unit cost includes D&A. Quantities are lb of U₃O₈. Information as of Sept. 18, 2026.

Cameco

Cameco Price scenarios

CAMECO | TWO-YEAR PRICE SCENARIOS

NYSE: CCJ • USD per share • Historical daily closes + illustrative September 2028 outcomes

\$92.80

17 SEP 2026 anchor

Investment Strategy — Long CCJ, but with confirmation

POSITION: LONG | HORIZON: 12–18 MONTHS

1 URANIUM MARGIN

Watch realized price vs. unit cost. 2026 guidance: C\$91–96/lb realized price and C\$63–67.50/lb unit cost of sales.

2 SUPPLY EXECUTION

Cameco targets 19.5–21.5M lb of production and 29–32M lb of deliveries. Extra purchased pounds can raise costs.

3 WESTINGHOUSE CASH

Track definitive AP1000 orders, equity earnings and dividends. 2026 Cameco-share EBITDA guidance: US\$370–430M.

PRACTICAL METHOD

- Establish the position only while the three operating tests remain intact.
- Reassess after each quarterly result: realized price, unit cost, production, purchases/inventory, Westinghouse orders and dividends.
- Treat headlines as confirmation only when they translate into reported margin, earnings or cash.
- The strategy is not based on uranium spot price alone: Cameco's long-term contracts and purchased pounds can delay or offset the benefit of higher spot prices.

Investment Strategy — Scenario & Risk Controls

The position stays attractive only if the operating evidence confirms the thesis.

BULL — THESIS CONFIRMED

- Realized price rises faster than unit cost
- Production moves toward the top of guidance
- Definitive AP1000 orders convert into earnings and dividends
- Cash generation improves

BASE — STAY DISCIPLINED

- Gradual contract repricing
- Production remains within 19.5–21.5M lb
- Purchases and inventory stay within plan
- Westinghouse progresses selectively

BEAR — REASSESS

- Price ceilings keep realized prices from improving
- Outages force expensive purchases
- Production guidance is cut
- Westinghouse projects slip or cash to Cameco stays limited

KEY RISK: VALUATION

The red-team analysis identifies valuation as the largest risk in the current deck. A strong company can still deliver weak stock returns if expectations and the valuation multiple are too high.

THESIS-BREAK CHECK

Reassess the long position if production guidance is cut, unit cost moves above guidance without offsetting margin growth, or Westinghouse progress fails to translate into earnings/cash.

Investment Strategy — Exit and Monitoring Triggers

SAME 3 TESTS, NOW AS ADD / TRIM SIGNALS | REVIEW: QUARTERLY

1 URANIUM MARGIN

Add:

Full-year price above C\$91–96/lb, cost inside C\$63–67.50/lb, gross profit up.

Trim:

Spot rises but realized price lags 2 straight quarters, gross profit flat/down.

2 SUPPLY EXECUTION

Add:

Output tracks 19.5–21.5M lb; purchases stay within the guided mix.

Trim:

Disruptions push purchases beyond plan or unit cost above C\$67.50/lb.

3 WESTINGHOUSE CASH

Add:

Definitive AP1000 agreement signed; equity earnings and dividends rise.

Trim:

Projects slip, or capex share rises while dividends stay at/below 2025 level.

CHECKPOINTS & PORTFOLIO-LEVEL RULE

- Q3 2026 results (~Oct 30, 2026): first read on all three tests above; full-year outlook, Feb 2027.
- Secondary checkpoints already flagged in the catalysts section: Port Hope CNSC hearing (Nov 2026); any AP1000 agreement, any time.
- **Portfolio-level rule: trim a portion if price nears the illustrative bull-case ~\$153 (Sept 2028) before at least two of the three tests above have actually confirmed — don't let multiple expansion substitute for the fundamentals.**
- These add/trim signals reuse the same evidence already defined for the catalysts (slides 38/39) — no new criteria introduced here.

Cameco

What can go wrong – Reasons not to buy Cameco

01 Uranium upside is capped

Spot +US\$5/lb
2026 adjusted earnings: -C\$2m
Contract ceilings limit near-term gains.

Management sensitivity

02 Weak cash conversion

H1 operating cash flow: C\$109m
Capital spending: C\$184m
Cash flow less capex: -C\$75m

Before financing-classified interest

03 External supply dependence

2026 production: 19.5–21.5m lb
Deliveries: 29–32m lb
Purchases and inventory fill the gap.

Management guidance; owned-and-operated production

04 Westinghouse needs capital

2026 capex: US\$160–200m
Finance costs: US\$120–135m
EBITDA is not distributable cash.

Cameco's share; management guidance

05 Projects can slip

AP1000 guidance depends on definitive agreements and progress.
Delays can defer earnings.

06 Entry price matters

Strong growth may be priced in.
Lower earnings + a lower multiple can compound shareholder losses.

Valuation risk; current multiple not verified

WHAT WOULD CHANGE THE VIEW?

Better cash flow • Reliable deliveries • Funded projects • Margin of safety

Cameco

Red Team: Summary of ChatGPT thesis

Cameco (CCJ) Investment Thesis

Moderately bullish over ~2 years

Core thesis

Cameco benefits from nuclear growth through 3 businesses:

- Uranium mining
- Fuel services
- 49% of Westinghouse

5 Key Drivers

Contract repricing

- ~28M lbs/yr contracted through 2030
- New contracts may lift realized prices

Mine execution

- Hit guidance at key mines
- Less reliance on costly outside purchases

Westinghouse

- 49% stake adds second growth engine
- AP1000, services, and fuel exposure

Policy tailwind

- Energy security supports nuclear
- Stronger contracting and demand backdrop

Key risks

- Weak near-term free cash flow
- Production, execution, and valuation risk

Investment question

Can higher uranium pricing, solid production, and Westinghouse growth justify the current share price?

Illustrative 2-Year Scenario Range

Bear:
\$59

Base:
\$110

Bull:
\$153

Current:
~\$92.80

Illustrative scenarios, not intrinsic value estimates.

- Claude is prompted to be the red team opponent to challenge our thesis
- The prompt specified to identify the strongest disconfirming evidence & hidden assumptions, without disagreeing for the sake of disagreement

Red Team: Using Claude as a Challenger

- I gave Claude additional information based on what it asked:
 - **Bloomberg report as of Sep 18:** according to anonymous sources, is seeking a \$50B valuation and a public filing as soon as October
 - **Government contract update:** remains conditional, but \$80B partnership is real at the term-sheet level

Red Team: 3 Biggest Risks to the CCJ Thesis

What could break the bull case?

1. Cash flow lag

What matters:

- Higher uranium prices may not lift cash flow soon
- 1H26 operating cash flow: C\$109M vs C\$575M a year earlier
- Contracts cap upside, while purchased uranium gets more expensive

Timing note: cash flow is lumpy

What would change the view?

- Strong Q4 or new contracts with higher ceilings

2. Westinghouse valuation risk

What matters:

- IPO could test a value not yet backed by signed deals
- CCJ expects 2026 Westinghouse EBITDA share of US\$370–430M
- A rich IPO price could be hard to support

Risk works both ways

What would change the view?

- Public filing shows signed orders, cash payouts, and CCJ keeps stake

3. Execution + valuation risk

What matters:

- Operations had flooding and a Cigar Lake outage
- 1H26 production: 10.1M lb vs FY guide of 19.5–21.5M lb
- More outside purchases can raise costs

Market is still looking past misses

What would change the view?

- 2H production meets midpoint, purchases stay under 3M lb, unit costs fall

Red-team takeaway: The long thesis may still work, but the main fault lines are near-term cash flow, untested Westinghouse value, and operating execution.

Red Team: Results & Conclusion

- Does this change the thesis?:
 1. Cash flow Lag Risk: **70% Agreement**
 1. ChatGPT agreed that the current contract structures (price ceilings) can delay the impact of rising uranium prices
 2. Original direction holds, but timing is slower
 2. Westinghouse Valuation Concern: **55% Agreement**
 1. ChatGPT agrees that the IPO will test Westinghouse's valuation and that it is reliant on future projects, but it is meaningful
 3. Valuation Risk: **85% Agreement (LARGEST RISK)**
 1. The TTM PE is at 158, so there is less upside considering it is pricing in uranium price growth & Westinghouse growth
 2. A base case of \$110 is about 9%/year till 2028, which is not a great cushion given the valuation

Conclusion

**AI improves research efficiency.
Investment conviction still requires verified evidence.**

AI contribution	ChatGPT organized the research into dashboards, company analysis and catalyst scenarios.
Research discipline	Gemini checked data consistency. Claude challenged the thesis. Human review remains essential.
Cameco conclusion	Conditional long thesis. Valuation is the main risk. Track uranium margins, supply execution and Westinghouse cash.
Decision rule	Review the operating evidence each quarter. Reassess if execution weakens or valuation outruns fundamentals.
