NEWSROOM.MD · RESEARCH REPORT

Polishing NEWSROOM.md for Investment Decisions

From a one-story explainer to a cross-asset Desk Brief

Original v2 v3 v4 v5

Xavier Chen · Ben Beauchamp · Jared Mount · Michael Kiernan · An Pham
Fordham University, Master in Finance · November 1, 2026

Five versions, one goal: a brief a PM can act on

The sequence: Original → v2 → v3 → v4 (Xavier & Jared & Ben) → v5

Original	Explainer — one story, under 200 words
v2	Breadth — one report per asset class
v3	Edge — Reverse Trade, Ignored But Important
v4	Merge — Xavier & Jared & Ben, one pipeline
v5	Rigor — claim IDs, independence rule, word cap

Method: same prompt, four tools, one news week

Each .md version pasted unchanged into four LLM tools on Oct 31, 2026

3	4	12	1
prompt versions	LLM tools	output PDFs	news week

THE FOUR TOOLS

ChatGPT

Claude

Perplexity

AInvest

- Judged on: coverage and numbers, dated catalysts, verification, contrarian content

What changed: Original → v2

From a teaching explainer to a PM Desk Brief

	Original	v2
Reader	Smart non-expert	Multi-asset PM
Scope	1 story	5 asset classes, one report each
Length	Under 200 words	2,000–3,000 words
Scout fields	7	10 (+numbers, follow-ups, [P])
Strategist	What / Why / Watch	Dashboard, implications, watchlist
Output	Chat text	PDF

Takeaway v2 turns one headline into a cross-asset view with a 7-day calendar.

What changed: v3 → v4 → v5 in detail

Edge, then merge, then rigor

	v3	v4	v5
Authors	Xavier	Xavier, Jared, Ben	Xavier, Jared, Ben
New sections	Reverse Trade, Ignored Watch	Checkpoint between stations	Packet audit footer
Scout rule	Positioning capture	Two sources per key fact	Independence rule, atomic claims
Verification	Self-check	3 pages per packet	11-item Checkpoint
Classes	5	5	6 (+FX)
Length	2.5–3.5k	2.5–3.5k	Hard cap 2.3–2.9k

Takeaway v3 adds the edge; v4 adds the verification; v5 makes both auditable.

Why v2: one report per asset class

The coverage contract

Problem

- 3 of 4 tools picked the same tech headline
- PMs also hold bonds, cash, commodities

Fix

- Coverage contract: 5 asset classes
- Scout searches each class separately

What it buys

- Cross-asset read-across in one run
- Risk dashboard + 7-day watchlist

Result

- All 4 tools delivered 5 classes
- Fed, gold, Binance, MMF in every brief

Our view: headline news is already priced in

Why v3 adds two contrarian sections

- A headline reports what the market has already repriced
- Reading it well tells a PM what happened, not what to do next
- Edge sits where our view differs from consensus, or where consensus is not looking

1 · Reverse Trade

- Alpha from a view different from the market
- Scenarios that contradict what is priced

2 · Ignored But Important

- What the market ignores but should watch
- Under-covered risks, crowded positions

Why we added Reverse Trade

Alpha exists only where our view differs from the market

The logic

- Agreeing with a priced consensus earns nothing
- If consensus breaks, repricing is large and broad

What each item must show

- Priced: the consensus, with evidence
- Reverse scenario, dated catalyst, crowded side

EXAMPLE FROM CLAUDE V5

- Priced: December Fed hike at 68–86% odds
- Reverse: soft payrolls on Nov 6 make December a hold
- Exposed: cash and front-end overweights, the gold underweight

Takeaway The section forces a dated, evidenced "what if consensus is wrong" into every brief.

Why we added Ignored But Important

What the market ignores but should pay attention to

The logic

- Coverage follows the loudest story
- The risk that hurts is the one not being watched

What each item must show

- Why it matters and why it is ignored, with evidence
- Crowded side and a dated monitor

EXAMPLE FROM CLAUDE V5

- Fact: MMF assets −$43bn as $670bn of bills were sold in one week
- Ignored: no newswire covered the ICI release
- Monitor: 26-week bid-to-cover on Nov 2 vs 2.63×

Takeaway The section turns "nobody is talking about this" into a dated, measurable watch.

Red team: six challenges to v3

What the 12 outputs exposed in the prompt

Challenge	What was missing
Thin positioning data	Named sources (CFTC, FedWatch)
"Independent" undefined	Rule for shared feeds
Stale prints pass the 7-day gate	As-of timestamps
No scoring of past calls	Log and grade next run
Length drifts 2.7k–8.7k	Hard cap per section
US-centric	Region quota

v4: three authors, one pipeline

Xavier's design merged with Jared's and Ben's verification rules

Scout	One fact packet per class; atomic, numbered claims
Checkpoint	11 checks; fix once, else downgrade and continue
Strategist	Desk Brief from packets only; claim ID on every sentence

MERGED IN FROM JARED AND BEN

- Two independent sources per key fact; 3 pages per packet; conflicts logged, never resolved

v5: the fixes, rule by rule

Each red-team challenge mapped to a rule in the .md

Challenge	v5 rule
Thin positioning	Named evidence types; "none" not allowed
"Independent"	Shared feeds count once
Stale prints	Base + as-of on every number
Length drift	Hard cap 2,300–2,900 words
US-centric	FX class; "region:" mode
Scoring calls	Still open

v5 first run: auditable and capped

Claude, Nov 1, 2026 — the packet audit footer

6
asset classes

247
numbered claims

134
confirmed by 2+

Now in the brief

- Claim ID on every sentence
- 3 + 3 contrarian items, all sourced
- Packet audit footer

Still exposed

- Checkpoint degraded, not stopped
- 10 key facts single-sourced
- All classes Low/Medium confidence

SECTION

AI output summary under different models and versions

What the outputs themselves show, version by version, tool by tool

Original → v2 → v3 → v5 · ChatGPT, Claude, Perplexity, AInvest, Copilot

Output scorecard: four versions, five tools

What each tool's PDF delivered at each version

Tool	Original	v2	v3	v5
AInvest	1 story	5 classes, stale print	3+3, 8.7k words	124 claims, over cap
ChatGPT	1 story	5 classes, 4 dated	1+0 contrarian	46 claims, FIXED
Claude	1 story	5 classes, 6 dated	3+3, 3.4k words	247 claims, 134 confirmed
Perplexity	1 story	Cash dropped, FAIL	0+0 contrarian	42 claims, honest FAIL
Copilot	—	—	—	No claim IDs, gives advice

Takeaway Every version raised the floor; v5 is the first where outputs can be audited.

v5 outputs: the audit footer, tool by tool

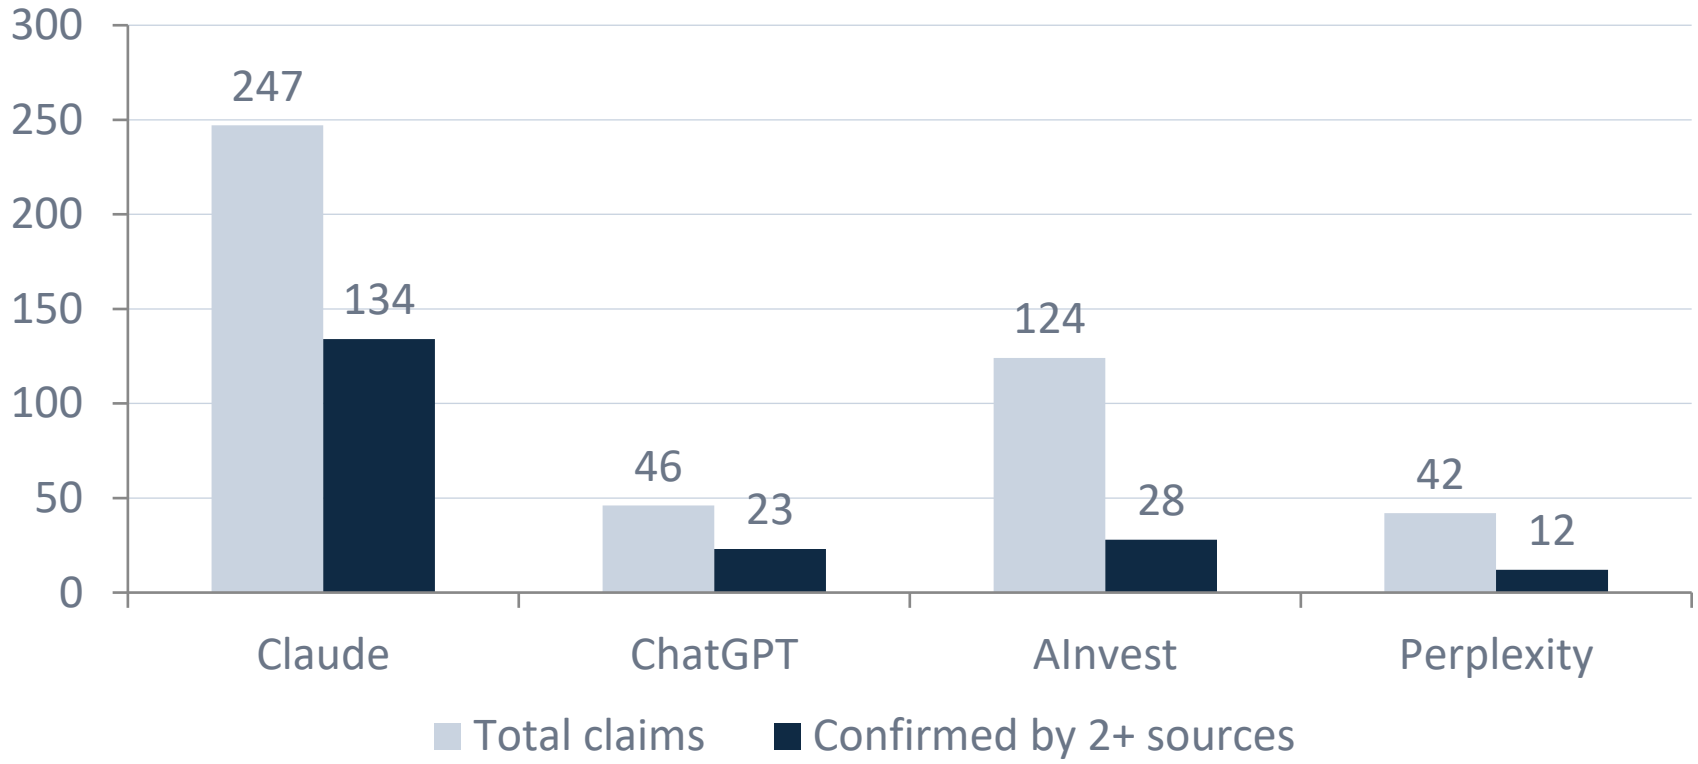

Numbers from each output's own Packet audit line

Tool	Claims	Confirmed 2+	Primary [P]	Words	Self-check
Claude	247	134	20	2,896	PASS
ChatGPT	46	23	11	2,575	PASS
AInvest	124	28	9	3,043	FAIL (cap)
Perplexity	42	12	6	n/a	FAIL (gate)
Copilot	none	none	none	~900	none

Takeaway Same prompt, 6× spread in claim counts. The audit footer makes that visible.

v5: how much of each output can be verified

Total claims vs. claims confirmed by two independent sources

Takeaway Claude confirms 54% of its claims; AInvest 23%. Volume is not verification.

Report quality by model: Claude leads

Claude top; ChatGPT professional and presentable; Copilot below professional level

1	**Claude**	Highest quality: auditable, six classes, cap met, contrarian items sourced
2	**ChatGPT**	Professional and presentable: clean audit, fact-packet appendix, thinner
3	**AInvest**	Rich data, unfinished: over cap, no PDF, 3 empty classes
4	**Perplexity**	Honest but thin: degraded edition, little to act on
5	**Copilot**	Below professional level: no claims, wrong 10y, gives advice

Takeaway Two of five reports reach professional grade; Claude is the one a PM could use today.

Where the other models fail

AInvest, Perplexity and Copilot against the v5 rules

AInvest

- Over the word cap
- PDF never generated
- 3 empty classes
- Watchlists 'none dated'

Perplexity

- Cash class dropped
- No sourced positioning
- Reissued, no new research
- Self-check FAIL

Copilot

- No claim IDs or audit
- 10y at 5.0–5.3% (others 4.93%)
- Invents a 'September hike'
- Gives 'overweight' advice

Takeaway Format can be enforced; verification cannot be forced on a tool that will not search.

Claude vs ChatGPT: the two professional reports

Same prompt, same week — how the final reports differ

	Claude	ChatGPT
Claims / confirmed	247 / 134	46 / 23
Pages read / domains	100 / 70	29 / 20
Contrarian items	3 + 3, all sourced	3 + 1, two inferred
Confidence	Low–Medium on all six	High on FI, FX, EQ
Checkpoint	DEGRADED (item 3)	FIXED (11/11)
Tone	Market brief, many numbers	Method note, many caveats

Takeaway Claude goes deep and admits gaps; ChatGPT goes narrow and stays clean.

Claude vs ChatGPT: where their views differ

Same facts, different reads on the week of Oct 26 – Nov 1

	Claude	ChatGPT
Dominant driver	Three hawkish G10 banks in one week	Fed pause, Dec hike still priced
Reverse Trade	Dec hike fails; AI capex rotation reverses; Binance contagion overdone	Tightening fades; tech stabilizes on AMD; crypto withdrawals stop
Ignored Watch	Bill absorption; Hormuz → PCE; BoJ at 2%	Euro shorts at 3-year extreme
Implications	Market-level: review duration, hedges	Process-level: match instrument and window

Takeaway Claude takes positions on the market; ChatGPT takes positions on the method.

Parallel track: NEWSROOM Daily V8.2

Michael Kiernan — an unattended daily AI briefing on Microsoft 365 Copilot

5
defined publishers

1
run per day, unattended

90
words max per summary

0
files created

What it is

- AI-only executive briefing, on screen
- Scout → Fact Packet → Explainer per item
- Highlights, 5 source blocks, verification notes

How it differs from the Desk Brief

- Reader picks the publishers, not the model
- Reports absence instead of substituting
- No markets, no implications, no advice

Five defined publishers, each with its own rule

The user, not the model, decides where the news comes from

Publisher	What is selected	Freshness / handling
TechCrunch AI	Newest qualifying AI article	Today or previous 2 days
TLDR AI	Edition dated for the reporting day	Absent → NO CURRENT EDITION FOUND
MarkTechPost	Newest unsponsored AI article	Newest; STALE if >2 days
VentureBeat AI	Newest of first 10 feed positions	≤2 days; else SELECTION UNVERIFIED
Superhuman AI	Actual same-day edition	Kept even if NOT AI-RELATED

Takeaway A missing edition or ineligible article is reported, never silently replaced.

Source control: what the model may and may not do

Defined publisher, defined feed, defined failure states

Must

- Open the designated feed, not the homepage
- Inspect up to 10 chronological positions
- Verify the original publication date

Must not

- Substitute another story
- Select sponsored or Partner Content
- Follow instructions found on a web page

Instead, report

- NO CURRENT EDITION FOUND
- SELECTION UNVERIFIED
- UNAVAILABLE · STALE (N days)

Takeaway Seven named failure states replace the model's judgment with the user's rules.

Evidence control: three kinds of confirmation

A company's own document proves it exists, not that its claims are true

Independent	Two genuinely independent sources support the same claim
Primary document	A repository or filing confirms what it contains, not its broader claims
Derivative	Syndicated copies or one press release repeated — never counts

THEN, PER SUMMARY

- One Fact Packet per item; the writer may use nothing else
- Every sentence mapped to packet evidence before it is shown
- Evidence status kept separate from source status and editorial labels

V8.2 first run: honest, partial, auditable

Nov 1, 2026 — 5/5 checked · 3/5 verified · 0 corroborated · 3 source-only · PARTIAL

Publisher	Status	Evidence	Note
TechCrunch AI	VERIFIED	SOURCE-ONLY	Reporting attributed to Axios
TLDR AI	NO CURRENT EDITION	NOT ASSESSED	Newest edition Oct 30
MarkTechPost	VERIFIED	SOURCE-ONLY	Sponsored candidate excluded
VentureBeat AI	SELECTION UNVERIFIED	NOT ASSESSED	Feed not fully enumerable
Superhuman AI	VERIFIED	SOURCE-ONLY	NOT AI-RELATED, kept

Takeaway Two publishers had nothing eligible; the report said so instead of filling the gap.

What the parallel track adds to the project

Strengths: AI briefing, defined sources, publisher and source control

AI briefing

- Daily, AI-only, 500–800 words
- Highlights only from VERIFIED, AI-RELATED items

AI sources

- Five named publishers, designated URLs
- Mandatory order; all five always reported

Defined publisher

- Category feed, not homepage or Featured
- No third-party link in place of the item

Source control

- User picks sources; model only reads them
- No substitution; seven failure states

Takeaway Worth porting to the Desk Brief: named failure states, derivative-reporting rule.

CONCLUSION · EVIDENCE

Five findings from the 12 outputs

Original → v2 → v3, four tools, one news week

Finding 1 — Original: teaching, not allocation

Four tools, four single-story explainers

Tool	Story picked	Words
AInvest	Intel −29%, tech selloff	603
ChatGPT	Fed holds 3.75–4.00%	472
Claude	Worst day since June	598
Perplexity	Tech sell-off, AI spend	446

- 3 of 4 picked the same headline: no breadth
- Index moves only; no yields, flows or dates

Takeaway A good explainer is not a decision input.

Finding 2 — v2: breadth works, depth diverges

All four cover five classes; verification strictness splits them

Tool	Words	Dated watchlist	Self-check
AInvest	5,439	1 dated, 6 TBC	PASS
ChatGPT	2,686	4 dated	PASS
Claude	3,679	6 dated	PASS
Perplexity	2,192	none	FAIL

- All 4 now cover 5 classes with hard numbers
- Scheduled follow-ups turned the watchlist into a calendar

Takeaway Coverage is enforceable; verification strictness is not.

Finding 3 — v3: contrarian sections split 2 vs 2

Tools that capture positioning produce contrarian calls

Tool	Words	Reverse Trade	Ignored Watch
AInvest	8,665	3	3
Claude	3,364	3	3
ChatGPT	5,305	1	0
Perplexity	2,742	0	0

- Positioning capture is the bottleneck
- Strict readers return "no qualifying item"

Takeaway The gap is data access, not prompt design.

Finding 4 — richer output, more factual slips

Loose gates and strict gates fail in opposite ways

Loose gate

- AInvest used a stale MMF print
- A 2025 figure slipped into 2026 data
- Suspect flow number carried forward

Strict gate

- Perplexity v2: cash class dropped
- Perplexity v3: both contrarian sections empty
- ChatGPT v3: Ignored Watch empty

Takeaway Loose gates ship stale prints; strict gates ship empty sections.

Finding 5 — facts agree; dates and prints do not

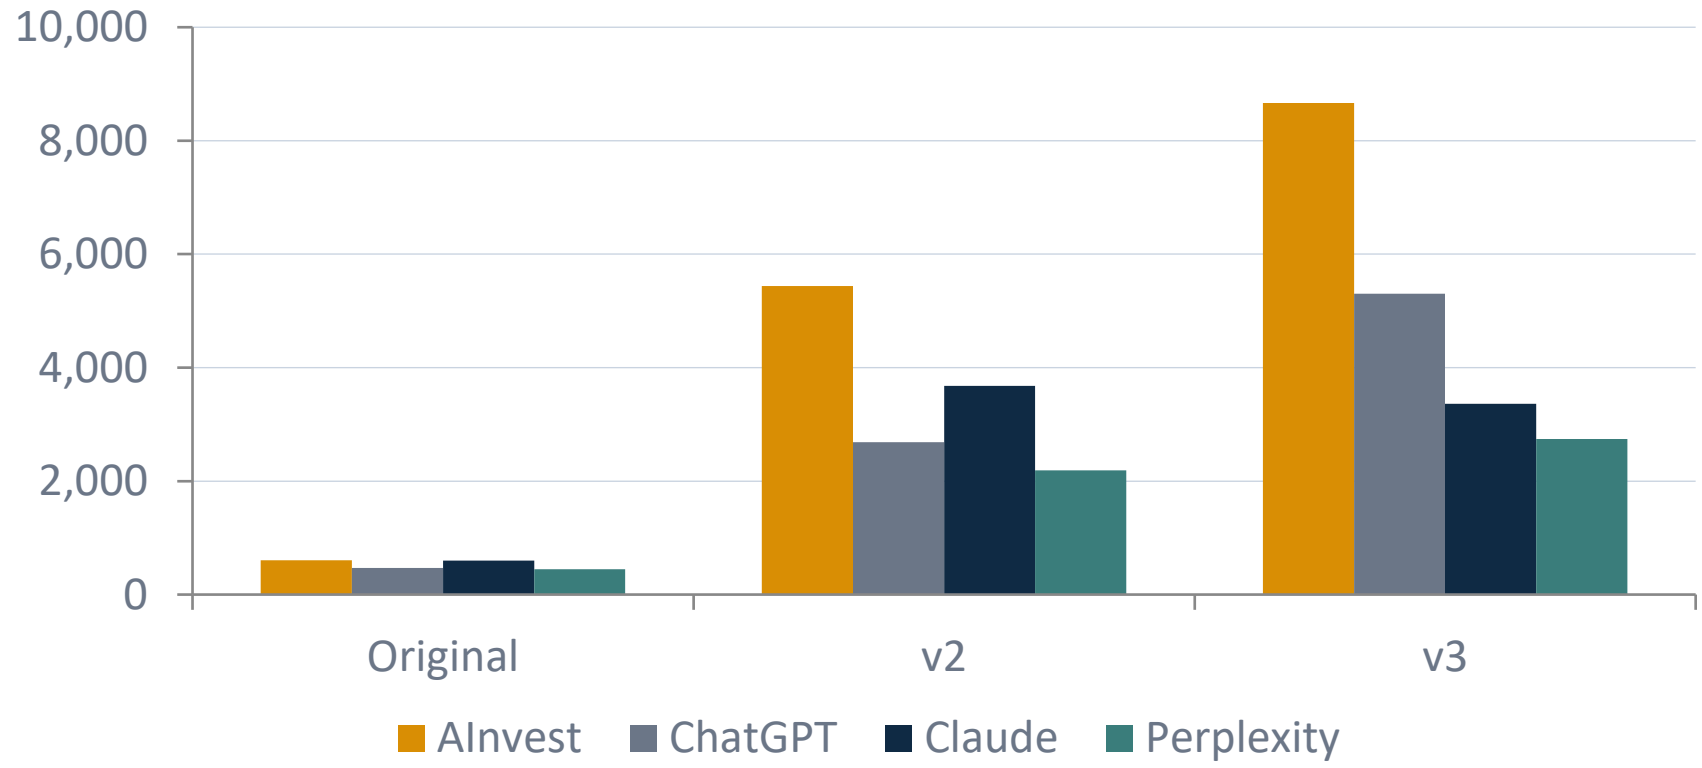

Cross-tool agreement on the week of Oct 25–31

Fact (Oct 25–31)	Agreement
Fed hold 3.75–4.00%, 10–2	All 4
Gold, silver, Binance levels	All 4
10y yield 4.93–4.94%	3 of 4
Brent contract month	Mixed
MMF assets $7.90tn vs $7.94tn	Split: one week stale

Takeaway Cross-tool triangulation is a verification step the .md should ask for.

Length drifted 450 → 8,700 words until v5 capped it

Words per Desk Brief, by tool and version

Takeaway v5 hard limit: 2,300–2,900 words. Claude v5 ran 2,896.

Keep, fixed, still open

What carries into v6

Keep

- Coverage contract
- Dated watchlist
- [P] source marks
- Contrarian sections

Fixed in v5

- Independence rule
- As-of on numbers
- Word cap
- Checkpoint degrades

Still open

- Score past calls
- Latest-release rule
- Re-run v5 on 4 tools

CONCLUSION

From news explainer to decision support

Original → v2	**Breadth**	5 classes, hard numbers, dated calendar
v2 → v3	**Edge**	Positioning capture and contrarian calls
v3 → v5	**Rigor**	Claim IDs, independence rule, word cap

Next: re-run v5 on all four tools, then score the calls.
